

Flowering branches can be dried for a tall vase, though some kinds of blossoms keep their color and shape better than others. Choose branches with open flowers, dry them in a dark place with good airflow, and arrange them with a light touch.

## Select suitable branches

Start with healthy branches whose blossoms have opened but have not begun to fade. Flowers already losing petals are unlikely to look better after drying. Leave out any branches that feel wet or show possible mold.

Expect the flowers to change as they dry. Their colors may become softer or turn brown, while petals can curl or drop. Dried branches can still look appealing, but they will not match the fresh version exactly. If you have several branches available, dry a few more than you need in case some break or lose petals.

Cut each branch to a length that works for your vase, but leave extra stem so you can shorten it later. For woody branches, use clean, sharp pruning shears. Take off damaged leaves and any foliage that would make the lower part of the arrangement crowded.

## Let the flowers dry fully

Loosely gather a few branches and tie their stems together. Hang each bundle upside down in a dry, dark spot where air can circulate. Leave a little room between bundles so air can reach the flowers, and keep them away from direct sunlight to help prevent fading.

The drying period may last several weeks. How long it takes depends on branch thickness and the conditions in the room. Check the flowers occasionally and handle them gently. They should feel dry, not soft, and the stems

should no longer feel damp.

It is normal for delicate blossoms to shed petals during drying. Choose a spot that is easy to sweep, and avoid moving the branches more than needed.

## Build a vase arrangement

Use a sturdy vase whose base is heavy enough to hold the branches upright. A narrow opening can keep stems in position, but do not push a thick bundle through it. Once the branches are dry, they do not need water.

Set the tallest branch in the vase first, then add shorter branches around it. Turn the vase as you arrange the stems so you can check the display from several angles. Keep some space between branches to let their natural shapes show.

Put the finished arrangement somewhere protected from direct sunlight and damp rooms, and away from spots where people may brush against it. Fragile dried flowers can be hard to dust, so a sheltered location can help keep them looking neat.

## Helpful answers about dried flowers

### Can branches dry while standing in a vase?

They can dry in an empty vase, but may bend or shed petals as they change. Hanging branches upside down allows more air to move around the flowers.

### Should I put water in the vase?

No. Keep completely dried branches in a dry vase. Water can make the stems damp again and may encourage mold.

### How long can I keep the display?

There is no set lifespan. The type of flowers, the room conditions, and how often the branches are handled all affect how long they remain attractive.
