What is the Limbo Crypto Game?

Limbo is a crash-style casino game, though it varies slightly from standard crash games where a multiplier line increases continually until it crashes. Rather, Limbo is a target-multiplier game.

When a player opens a Limbo game, they configure two primary specifications:

1. **The Bet Amount:** How much cryptocurrency they want to bet on the round.
2. **The Target Multiplier:** The payout multiplier they wish to attain (e.g., 2x, 10x, 100x, or even approximately 1,000,000 x).

As soon as these are set, the gamer initiates the round. The game produces a random number. If the generated number is **greater than or equal to** the target multiplier, the gamer wins their bet increased by that target. If the generated number fails, the bet is lost.

How Limbo Works: The Mechanics Behind the Bets

To understand why Limbo is so popular in the crypto gambling neighborhood, one should look at its core engine: **Provably Fair algorithms**.

Unlike conventional online gambling establishments where game outcomes are determined on a black-box server, crypto-native games use cryptographic hashing (typically utilizing SHA-256). Before a bet is placed, the casino creates a hashed version of the winning outcome. After the round concludes, gamers can verify the math to guarantee the casino did not manipulate the result.
